## **XPR Nozzle Retaining Cap Change**

In the coming weeks you will notice visual changes to our Hypertherm XPR nozzle retaining cap, part number 420365. Hypertherm Associates continuously looks for opportunities to improve product performance, supply chain resiliency, and environmental impact. From this effort, our engineering teams have identified an alternative process to manufacture this retaining cap which will reduce plastic waste by more than 5,000 lbs. a year.

The new nozzle retaining cap design is functionally equivalent to the original part but is manufactured with features to improve grip and handling. We have fully vetted this design through internal engineering and manufacturing validation, as well as external field studies.
