Subject: MAXPRO200 celebrates its 10th anniversary!

On January 31, 2023, the Hypertherm MAXPRO200® LongLife® plasma cutting system officially celebrated its 10th anniversary of the first shipment from our manufacturing floor. And we are on track to celebrate another important milestone because we will be shipping our 10,000th system sometime this year.

With over 9,000 units delivered to the market to date, this conventional plasma system is truly a “workhorse”, engineered for heavy-duty, high capacity cutting applications. The MAXPRO200 delivers the fastest cut speeds in its class for maximized productivity and its advanced consumable life technologies reduce cost-per-part. With 50% fewer parts than the competition, the MAXPRO200 leads the industry in reliability. The system is easy to use and operates with either air, oxygen, or nitrogen plasma gas.

Whether at a shipyard, heavy equipment manufacturer, or steel service center, there is a good chance you’ll find a MAXPRO200 reliably working on a gantry table or robot, cutting day in and day out. The capabilities of the system continue to grow with the introduction of more specialty consumables, including ones that enable handheld torch applications, extreme angle beveling, and gouging.

We are looking forward to celebrating more milestones this year for the MAXPRO200.
